

**Fundamentals of
Programming for Business
(CS2016)**

Sessional II Exam

Total Time (Hrs): 1
Total Marks: 30
Total Questions: 5

Date: April 6, 2026

Course Instructor(s)

Nida Aslam, Shumaila Arshad

262-558

Roll No

2C

Student Signature

Do not write below this line

Attempt all the questions.

CLO 1: Understand basic problem-solving steps and logic constructs through computational thinking;

Question 1

[6 Marks]

- a) The following program is intended to print numbers from 1 to 5, but it contains errors. Identify and correct them.

```
i = 1
while i < 5
print(i)
i = i + 1
```

- b) Write a Python program to print all even numbers between 1 and 20, but skip numbers divisible by 4.

CLO 3: Apply basic programming concepts;

Question 2

[6 Marks]

- a) Write a function calculate(a, b) that returns:
- Sum
 - Difference
 - Product

Call the function and display the results.

- b) Write a program that takes two numbers as input and performs division. Handle the exception when division by zero occurs and display a proper message.

CLO 3: Apply basic programming concepts;

Question 3

[6 Marks]

- a) Analyze the following code and explain the output. Then modify it so that the global variable is updated.

```
x = 10
```

```
def change():  
    x = 20  
    print(x)
```

```
change()  
print(x)
```

- b) Correct the following program so that it updates the global variable correctly:

```
x = 5
```

```
def update():  
    x = x + 5
```

```
update()  
print(x)
```

CLO 1: Understand basic problem-solving steps and logic constructs through computational thinking;

Question 4

- a) Find and correct the errors in the following program:

```
def add(a, b)  
    return a + b .
```

```
print(add(5))
```

- b) Write a function student(name, age) and demonstrate:

- Positional arguments
- Keyword arguments

Call the function using both methods.

CLO 3: Apply basic programming concepts;

Question 5

[6 Marks]

Explain what will happen in the following code. Then modify it to handle specific exceptions properly.

```
try:  
    a = int(input("Enter number: "))  
    b = 10 / a  
    print(b)  
except:  
    print("Error occurred")
```
