Company Introduction

Digitrix Media, headquartered in Lahore, Pakistan, is a highly regarded company specializing in digital marketing and media services. They provide a wide range of solutions to help businesses establish and boost their online presence, connect with their intended audience, and achieve their marketing objectives.

Digitrix Media excels in several critical areas, including social media marketing, search engine optimization (SEO), content creation, and online advertising. Their comprehensive approach caters to businesses of all sizes, from startups to well-established enterprises.

Notably, Digitrix Media is adept at social media marketing, where they create engaging campaigns on platforms like Facebook, Instagram, Twitter, and LinkedIn. These efforts ensure that their clients connect effectively with their target audience by crafting compelling content and running precisely targeted ad campaigns.

For enhancing online visibility, Digitrix Media's SEO services are invaluable. They implement the latest industry best practices to boost website rankings and drive organic traffic, ensuring their clients' websites appear prominently in search engine results.

Another strong suit of Digitrix Media is content creation. Their skilled team generates blog posts, articles, videos, and infographics that effectively convey their clients' brand stories, thus enhancing their online presence.

Navigating the complex landscape of online advertising is simplified by Digitrix Media. Through careful strategy and data-driven campaigns, they help clients maximize their advertising investments, ensuring that each advertising dollar is used effectively.

In an ever-evolving digital landscape, Digitrix Media remains at the forefront of industry trends, offering innovative and practical strategies.

Transcript

As-salamu alaykum.

Wa alaykum as-salam.

Q1) So please introduce yourself And your Organization.

Yes, hi, my name is Arham. I studied software engineering from Beacon House National University. Professionally, I serve as user experience professional or you can say UI UX designer. And I had a privilege of working with both local and international clients with multiple companies in Pakistan, starting from a startup to a well-established company [digitrix Media]. So yeah, it's going good.

So why you choose UI UX designing over coding?

I wasn't a bad coder, but I was a very good designer. And early on in my career, I realized that to be a good software engineer, you didn't need to be, you should be good in, you know, programming, you should know how to program. But it doesn't mean you should be best at it. You can be best at anything because IT is like if you become a doctor, a physician, you can be a heart specialist, you can be an orthopedic or something else. So IT is a very vast field. It has very many, many, you know, branches or something. In one software house, there is not just one coder. There is a project manager, there's a design team, there are cyber security person. So if you're good in networking, you can be in a cyber security field. So I was good in designing because I started my side hustle or you can say, while I was studying, I was working as, you know, design expert in agencies, designing Facebook posts and stuff like that. So I realized that I have to find a way in my own major, which was software engineering, so I can be good at it or just not good at it, best at it. So, yeah, I found it. So you are in financial business computing? FinTech, financial technology. So exactly. Now you're part of the IT circle, but you're going to be best at finance or business things of it. So, yeah, it's not

just about coding. So if you were a software engineering major, so I would totally tell you, that do a good project in the final year, whether in PHP or Java or whatever language you choose. But your career choice should be what you love to do. Exactly. OK, so

Q2) What are the critical IT systems, applications and technology that play a fundamental role in supporting and advancing your business operations?

My business operations are mostly, you know, design operations or user experience operations. I work with a very creative team. We have interns, we have, you know, fresh graduates or very experienced designers. So, you know, creative people have a lot of opinions. So I get to correct them and learn from them and I have to keep check on them because I have to discipline them as well. So I tend to use Trello. It's a management tool where I can post tasks and keep check on them and they can, you know, talk to me or to the team and have discussions there. But if you talk about the systems we work with or which help to design, the primary tool is Figma, Adobe XD. I use Adobe Illustrator, Photoshop, anything, you name it. But my organization right now is working on Figma.

OK, Any specific memorable project or client you work with?

Hmm. Yeah, I have a lot of projects, a lot of international projects. I worked with a Fritilla company. I did their work. It was very memorable because it was very challenging. But for me, most memorable project was where I did the best work of mine because I was a very fresh graduate, fresh out of the university. I didn't know how to use most of my tools which were available to me. But there was a company, uprising company, which was going to be the competitor with Zameen. It was called Land Hub. At that time, I was working with Technovia and I had my hands on everything from logo to their website, to their web application. So, I did almost all the work for them and I was proud of it. I was proud of my work. It was very challenging, but I did it. So, I keep remembering that whenever I face new challenges. Because if I did that in my childhood, I call it childhood. Because if I did that

without letting my boss know that half of the time I had to go to YouTube and learn things. How to, you know, design this or do that with a pen tool and everything. So, if I can do that, I can do this too. Right now, I am doing a desk job by the way. I just sit, relax and tell people to work.

Q3) How do the IT systems and application at your organization contribute to optimization and streamlining of the various business processes?

Yeah, I don't know how to answer it, but we not just use IT systems, we make IT systems. So, starting from the day, even starting from the attendance, the fingerprint you put, it's an IT system. It's an IT application and then the management tool, like I told you, Trello and other tools like that. And the rest of the conversation is on Slack. You guys use WhatsApp. You use Google Classroom. Yes, Google Classroom. So, it's like a Google Classroom Slack. So, yeah, it helps a lot because you can keep check on your team. You can make like groups and stuff like that. So, yeah.

So, how it helps the company?

Anything which helps the business helps the company. And when there's free flowing, seamless, you know, employee journey or, you know, work. So, it always helps the company. So, using the IT systems always help the business because it helps you to integrate your team well. So, yeah.

Q4) How much does your team help keep your computer systems, software and technology running smoothly?

So, it's not my team's job to keep the systems running smoothly because it's a user experience design team. Yeah, just like other companies have an IT team, we have an IT team which keeps them running smoothly. But if you ask about how I work with my team or how my team works, so I myself climbed up the ladder being an intern making Facebook posts for some agency to heading a design team. And I value teamwork heavily. It's a mutual learning

experience. My role is in which I realized and I learned by working as a junior because the manager's role is not just to dictate, definitely not to dictate, but to guide, correct and let the fresh minds also flourish. Because when you are working with a creative team, they have a lot of ideas. Because creative people have a lot of opinions and everything. So, sometimes you have to correct, sometimes you have to scold, but sometimes you also get to learn. Because by the time I graduated, it was way back. Or like we say in other languages, boomer. So, I don't want to be a boomer. So, when new kids come, I try to learn new things from them. Because maybe they are not perfect, but they definitely have fresh ideas. So, my job is not to let them get distracted and do their job perfectly. Okay. So,

Q5) Walk us through a typical work day in your professional life.

So, yeah, my typical day for me involves a lot of collaborations and teamwork and friction as well. Because either I'm brainstorming sessions, sketching out designs or in back and forth with the development team. I sit with the client meetups as well, so I have to guide them and get learned from them. Because it's very important. The challenge is always to translate the client's vision into a tangible design without losing the user perspective. Because my expertise is in the user experience more than the development part or even the design part. So, the most common example I give to the client so that they understand what my role is. That they should know that the OK button can always be in green color.

Sir, if your theme is red, then I cannot make an OK button with a red and a no button with a green. Because that's how the human mind works.

And you have to guide them as well and learn from them what they want. So, you have to translate it into design. And what are the most recurring challenges? Recurring challenges are, you know, even when we have a big short client.

When I say big short, it means a client from UK or US. But he's in his 60s or 40s or 50s. He'll be a rigid person.

He'll never get you, understand you. Because the way you want to talk to him. So, I had this client, Fretila. It was a major, major company, courier company with trucks and everything in US.

And he has all the money, he has all the time, he has all the resources to give us. But he was very rigid. So, it was a very big challenge to, you know, it was very difficult to convince him. It was very difficult to convince him that, Baba ji, what you're saying, it will happen. But it won't be user-friendly. When your system is not user-friendly, you can make it as beautiful as you want.

You can make it as beautiful as you want. But it's always going to hurt your business. If it's going to hurt your client while using that system. So, yeah, it can be challenging sometimes. Okay.

Q6) In the fast-paced IT industry, what emerging technologies or trend do you believe will have a significant impact near in the future?

I know most of people are going to say AI. But back in the day, AI, for other people other than IT people, even for the software engineers, AI was a myth. And I'm sure most of you are using chat GPT by now, understanding questions. I won't say plagiarism and everything. But people are missing out on AR and VR technologies, I must say, with AI. Because in this rapid development, AR and VR technologies and machine learning, AI is going to be the game-changing.

Especially for UI, UX and the integration of those technologies. I think it's going to redefine the user experience. Because in today's world, the critical thinking, you can think out of the box. Because the critical thinking in the box is being given to you by AI. The difficult computations are being given by AI. So, AR and VR is being used for architectural design, for interior designing. The sky is the limit and it has just started. So, I'm pretty sure that in the future, many, many creative workers are going to get more creative. It's not going to eat any

jobs. I don't know if self-driving trucks, obviously self-driving trucks or some company like Elon Musk has, can eat jobs for drivers. But it's not going to hurt any IT guy or some people with creative or critical work. Because you are getting an assistant from AI. It's not taking your job. So, now you are getting more opportunities to excel. You are getting more opportunities to do better work.

And maybe, you know, Photoshop has also integrated that AI tool in it. So, it's going to be very interesting in future. So, I'm looking forward. Okay.

So, what are your future goals?

future goal is to start my own business. Right now, I'm working with a company, but I do side hustle as well. I find my own work as freelancer because I'm, you know, gathering money. So, I can start my own software house and make my own thing. Okay.

So, best of luck. Best of luck to you.

Thank you very much.

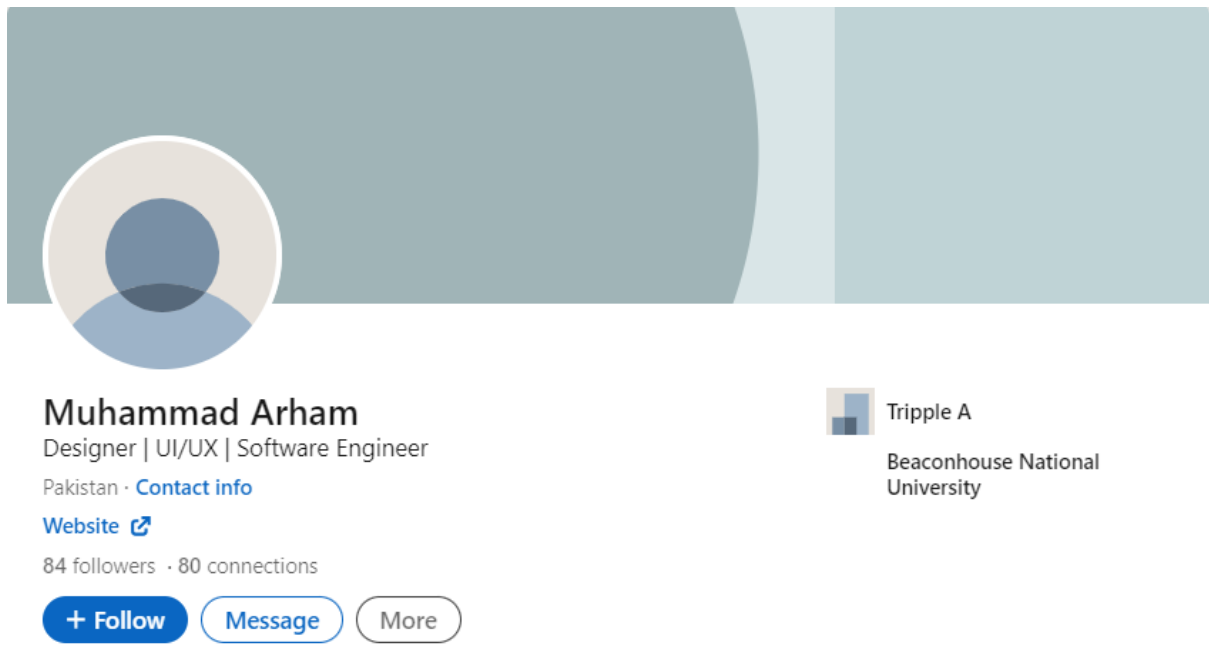

Best of luck for your assignment and future things.

Thank you very much.

It was good.

Learning Outcomes [summary]

- There is a misconception that we think IT is only based on coding but IT is not limited to programming, it is a very vast field. There are so many branches of IT like UI/UX designing, data analysis, financial technology and many others. If you do any specific field, you should be best at it.
- I have learned that everything is not for money but we have to do some projects or work just for experience, creativity and passion.
- I have also learned that in order to create an innovative culture we make different groups or workgroup teams to promote creativity, hence you should learn to work with different people, groups or teams because creativity comes from different ideas, opinions and discussions
- .I have been made aware of the fact that we should be loyal to our company because in that way we will increase the productivity of an organisation.
- This interview also sheds light on the fact that a manager's role is not only to dictate but to guide, correct and lead the fresh mind to flourish because when we work with the creative team they have a lot of opinions and ideas so sometimes you have to correct their mistakes and diagnose their problems.From these mistakes you have got something to learn.
- This discussion on emerging technologies like AI,AR and VR highlights their potential impact on various industries, not just design, and the need to stay updated with technological trends.
- I have also inquired that In order to bring the business in streamline, it requires services from different softwares like TRELO in project management, FIGMA for cloud base services like UI/UX enabling real time collaborations. These services enable the business for better coordination between team members.
